Are you paying for agents you don't need?

A forecast that's 10% off on a 50-agent team means about 5 agents too many, or too few, every week. I build contact-volume forecasts you can check before you staff to them.

What I do

1. **Backtest your forecast.** Score your current method on past weeks it didn't see.

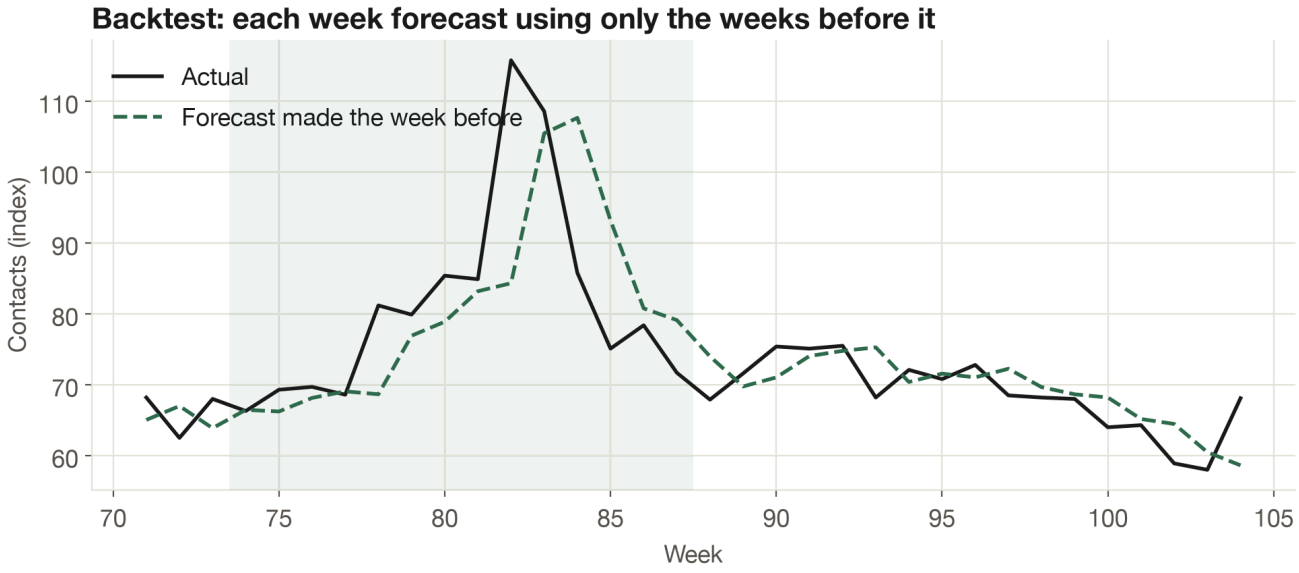

2. **Build a better one.** Compare methods the same way and keep the one with the best record.

3. **Plan the staff.** Agents per week, an 80% range, and flexible capacity for peaks.

Recent work

For a consumer retail support team whose volume had been falling for two years, I compared several forecasting methods on a rolling backtest and built a year-ahead staffing plan.

- One week ahead, the forecast was within 10% in about **five of every six** normal weeks (about one in three at eight weeks, so the plan is reissued monthly).
- The holiday peak needs **2 to 3 times** baseline capacity, planned as a flexible pool rather than permanent hires.

Indexed and altered to protect the client.

Pricing (USD)

- **Free backtest:** your current forecast scored against mine, with the staffing gap in hours and dollars.
- **Forecast & staffing build:** $600–1,200, one time.
- **Monthly plan:** $400–800 a month: an updated forecast, a staffing plan and an accuracy report every month.

> **Start with the free backtest.** Send 12+ months of weekly contact volume under NDA. Report within two weeks. Weekly counts only, no customer data.
